Functional
Majorants

Certain Further Applications of the Principle of
Majorants," L. V. Kantorovich, Moscow Branch of
Math Inst Imeni Steklov, Acad Sci USSR

"Dokl Ak Nauk SSSR" Vol LXXX, No 6, pp 849-852

In a recent article ("Dokl Ak Nauk SSSR" 76, 17,
1951) the author indicated the possibility of
employing the principle of majorants for establish-
ing the existence of the solution of nonlinear
functional eqs and the convergence of successive
217762

approximations, Newton's process in particular.
In current article the author gives further
applications of this method, particularly its
utilization in establishing the uniqueness of solu-
tion and in investigating eqs that depend upon a para-
meter. Submitted 27 Jul 51 by Acad V. I. Smirnov.

Kantorovich, Leonid Vital'yevich and Krylov, Vladimir Ivanovich

Priblizhennyye metody vysshego analiza (Approximation Methods of Higher Analysis) 4th ed. Moscow, Gostekhizdat, 1952. 695 p. 25,000 copies printed.

Ed.: Akilov, G.P.; Tech. Ed.: Volchok, K.M.

PURPOSE: This book is intended for scientific workers in mathematical physics, mechanics and other applied sciences.

COVERAGE: The book is a systematic presentation of the approximate solution of problems of mathematical physics, mechanics and other applied sciences. It includes methods of representing the solution of a problem in the form of infinite series, relaxation methods and variational methods. A large part of the book is devoted to problems of conformal mapping and their application in the solution of fundamental problems of mathematical physics and other applied sciences. Methods of approximate solution of an

Card 1/17

Approximation Methods of Higher Analysis 1007

integral equation of the Fredholm type and the application of integral equations to the solution of the Dirichlet problem are studied. Many illustrative examples are given. Chapters 1, 2 and 4 were written by L.V.Kantorovich, Chapters 3, 6, 7 and part of Chapter 5 were written by V.I.Krylov, and section 10 of Chapter 5 was written by N.P.Stenin. There are no references.

 TITLE On integral operators.
 PERIODICAL Uspechi mat.Nauk 11, 2, 3-29 (1956)
 reviewed 1/1957

The author proved some theorems on integral operators. The theorems are generalizations of those assertions on integrals of potential type which Sobolev has used for the proof of his "imbedding theorems" (Mat.Sbornik, n. Ser. 2, fasc.3, (1937)). The obtained theorems on integral operators are used in order to prove Sobolev's inequation and the mentioned imbedding theorems.

On a Mathematical Symbolism which is Convenient for Carrying out Computations by Means of Machines. (Ob odnoy matematicheskoy simbole, udobnoy pri provedenii vychisleniy na mashinakh, Russian) Doklady Akademii Nauk SSSR. 1957, Vol 113, Nr 4, pp 738-741 (U.S.S.R.)
Received: 6 / 1957
Reviewed: 7 / 1957

ABSTRACT:

It is necessary to develop practical, convenient, and universal methods for the introduction of numerical, analytical, logical and also other problems into electronic computers. Also uniform methods are needed for carrying out these computations. For this purpose the following three problems have to be developed: 1.) Introduction of a uniform symbolism. Such a symbolism has to be universal, exact, unequivocal, compact and easy to use in machines. 2.) Development of convenient forms of writing on the material to be used in the machine. 3.) Development of uniform methods for the working out of the mathematical problem without taking account of its concrete contents. Schemata: The various (finitely numerous) mathematical objects are described independently of their nature (numbers, vectors, functions, operators, etc.) with whole numbers. As a basic form for the recording of a certain mathematical specification an abstract scheme is selected which defines the relations between the individual objects. The operators are best included within a number of elements of the "field" of the objects. The notion of an "explicit" scheme is defined,

Card 1/2

On a Mathematical Symbolism which is Convenient for Carrying out
Computations by Means of Machines. PA - 3031

as well as that of the "solution of the scheme". The elements of an explicit scheme are transformed in a natural manner into a partly ordered quantity. Further details are discussed.

Simplifications and Transformations of the Scheme: The author discusses some concrete operations connected with the treatment of abstract schemes.

Analytical Transformations: The programs of the general transformations of the schemes can be used for various analytical computations carried out by means of computers.

Computations: A universal program for the computation of the values of an explicit scheme can be constructed within a certain program. Various fields of application for this general computing process are described. (No Illustrations).

TITLE:

On the Methods for Analyzing Some Extreme Problems of Production Schedules. (O metodakh analiza nekotorykh ekstremal'nykh planovo-proizvodstvennykh zadach)

PERIODICAL:

Doklady Akad.Nauk SSSR, 1957, Vol. 115, Nr 3, pp. 441-444 (USSR)

ABSTRACT:

The methods of analyzing the mathematical models of the corresponding problems are of essential use to the investigation of problems connected with the establishment of a rational plan for the best utilization of the resources and for the maximum output of production. One may have 1 sort of final products, m sorts of intermediate products and n sorts of production factors. One may further have N technological manufacturing processes. Any of these processes $\pi_s (s = 1, \dots, N)$ is characterized by the three vectors $X^{(s)} (x_1^{(s)}, \dots, x_1^{(s)})$, $Y^{(s)} (y_1^{(s)}, \dots, y_m^{(s)})$, $Z^{(s)} (z_1^{(s)}, \dots, z_n^{(s)})$

The components of these vectors indicate the production volume of the final products, of the intermediate products or of the manufacturing factors. The admissible plans are defined as positive linear combinations of the main processes, i.e. the plan P is defined by the vector $P(p_1, \dots, p_N)$. The plan shall be determined under the following conditions. 1) The expenditure of production factors is limited by a certain vector given here. 2) No consumption of

Card 1/2

On the Methods for Analyzing Some Extreme Problems of Production Schedules. 20-3-4/59

intermediate products takes place. 3) The volume of the final production shall reach a maximum under consideration of an assumed assortment. A corresponding theorem and some consequences following from it are given. Various methods based on the use of "solving factors" can be used for the effective solution of problems of the construction of an optimum plan. These methods then furnish the characteristic of the optimum plan. For the simultaneous determination of the optimum plan and the system of the factors various processes of successive approximation can be used: 1) Successive improvement of the plan, 2) approximation by conditionally optimum plans. 3) Approximation to the system of the factors and to the plan by the introduction of bilateral limits for the value of the factors. There are 7 references, 5 of which are Slavic.

TITLE: On a Function Space and Some Extremal Problems (Ob odnom funktsional'nom prostranstve i nekotorykh ekstremal'nykh zadachakh)

PERIODICAL: Doklady Akad.Nauk. SSSR, 1957, Vol. 115, Nr. 6, pp.1058-1061 (USSR)

ABSTRACT: The authors consider the linear normalized space $\Phi(B)$ of the completely additive functions being defined on the family B of Borel's sets of an arbitrary metrical compactum R . In deviation of the usual norm the authors introduce a norm which essentially uses the metric of R . Here it is stated that the space conjugated to $\Phi(B)$ consists of the functions defined on R , and satisfying the Lipschitz condition Lip' . With the aid of the introduced space several extremal problems are solved. The considered problems (displacement of masses, plan of operation) are already treated several times by Kantorovich [Ref 2, 3, 5].

ABSTRACT: The article is a report on a paper entitled "Linear Programming - a New Method of Finding the Optimal Solution of Economic Problems", read in January 1958 to the section by Ya.P. Gerchuk. The purpose and method of linear programming are briefly described and the claim is made that the mathematical method of determining the optimum allocation of economic resources now known as "linear programming" was first proposed in 1939 by the Leningrad mathematician, Professor L.V. Kantorovich, who published a pamphlet on it through the Leningrad University entitled "Mathematical Methods of Organizing and Planning Production".

Ms.: S.A. Volkov, and E.G. Starovoyev; Tech. Ed.: I.V. Sokolova; Managing Ed.: S.M. Litvinov; Literature on Machine-building Technology (Mechanics); Ye.F. Kuznetsov, Engineer.

PURPOSE: This collection of articles is intended for engineering and technical personnel in machine-building establishments, and for scientific workers and students of institutes and departments of engineering and economics.

SUBJECT: This collection of articles contains reports by workers from various scientific research institutes, and industrial establishments presented at the conferences of vums on the subject: "Organization and Planning of Uniform Operations in Machine-building Establishments." These reports discuss general problems encountered in organization, analysis, and theory of uniform production, as well as problems in schedule planning, technical preparation, and production specialization.

Funktsional'nyy analiz v normirovannykh prostranstvakh (Functional Analysis in Normed Spaces) Moscow, Fizmatgiz, 1959. 684 p. 6,000 copies printed.

Ed.: B. M. Makarov; Tech. Ed.: R. G. Pol'skaya.

PURPOSE: This book is intended for students specializing in mathematical analysis and computer mathematics.

COVERAGE: The book treats the theory of normed spaces, the theory of operations, and the theory of functional equations. Linear as well as non-linear operations and equations are discussed. In addition to the general theory, particular functional spaces and operations are considered. In particular, the spaces of differentiable functions of many variables, introduced by S. L. Sobolev, are treated. The Hilbert space and the theory of operators in it are considered as a part of the theory of Banach spaces. Of the other approaches to functional analysis, only

Card ~~1/8~~

Functional Analysis (Cont.)

Yu. B. Dykin, G. S. Shilov, and A. P. Yushkevich; Ed. (Inside
book): A. P. Lapov, tech. Ed.: S. M. Anisimov.

FOREWORD: This book is intended for mathematicians and historians
of mathematics interested in Soviet contributions to the field.

COVERPAGE: This book is Volume I of a major 2-volume work on the
history of Soviet mathematics. Volume I surveys the chief con-
tributions made by Soviet mathematicians during the period 1917-
1957; Volume II will contain a bibliography of major works since
1957 and biographic sketches of some of the leading mathe-
maticians. This work follows the tradition set by two earlier
works: Matematika v SSSR za pyatnadtsat' let (Mathematics in
the USSR for 15 Years) and Matematika v SSSR za tritsat' let
(Mathematics in the USSR for 30 Years). The book is divided
into the main divisions of the field, i.e., algebra, topology,
theory of probability, functional analysis, etc., and con-
tributions and outstanding problems in each discussed. A list-
ing of some 1400 Soviet mathematicians is included with refer-
ences to their contributions in the field.

of the AS USSR, and Gor'kov, L.I.

TITLE: Some Functional Equations That Arise in Analysing a Single-Product Economic Model 12

PERIODICAL: Doklady Akademii nauk SSSR, 1959, Vol 129, Nr 4, pp 732-735 (USSR)

ABSTRACT: For the investigation of economic processes the authors recommend mathematical models which lead to differential- and integro-differential equations which can be integrated numerically step by step. Thus it is possible to determine the influence of several factors (parameters of the model) to the economic characteristics of the process. The models may serve also for an examination of the exactness and legality of several methods of calculation usual in economy. Three cases are considered, e.g.: Let t be the time, $T(t)$ be the set of work at one's disposal, $R(t)$ be the raw materials at one's disposal. Let $U(R, T)$ be the set of goods produced in the unit of time. If $U(R, T)$ is assumed to be a homogeneous function, then

$$(1) \quad U(R, T) = \int_0^n R^{\alpha} T^{n-\alpha} d\alpha,$$

AUTHOR: Kantorovich, L. V.

TITLE: Some new approaches to computing methods and processing of observations

PERIODICAL: Sibirskiy matematicheskiy zhurnal, v. 3, no. 5, 1962, 701-709

TEXT: Some new methods of numerical computation are discussed, whereby modern computer and data processing problems can be more adequately solved than by the traditional methods. No new theory is developed but several concrete examples are given to illustrate such operations as determining the value of a polynomial at a given point; determining the bound of a linear form under certain conditions computing the upper and the lower bound of the solution to an algebraic system (for this purpose, an operator σ converting the lower into the upper bound is introduced); handling observations by evaluation of inequalities instead of by the traditional Gaussian method of least squares; the inverse problem in potential theory. In the final section of the paper, the completion of instable computation schemes by additional difference inequalities is

TITLE: Computer system consisting of a general purpose digital computer and a small computer. Class 42, No. 172567

SOURCE: Byulleten' izobreteniy i tovarnykh znakov, no. 13, 1965, 92

TOPIC TAGS: computer system, digital computer

ABSTRACT: This Author Certificate presents a computer system consisting of a general purpose digital computer and a small digital computer. The small computer contains a high speed arithmetic device with an operational memory unit with small capacity of trigger registers, a control microprogram unit, and a semiconstant memory unit for the normal program. To increase the effective response rate of this system by supplying a significant portion of the operations to the small computer, to broaden the class of problem solvable by the system by dividing the functions between the general purpose and small machines, and to utilize in the system any general purpose machine without significant changes in its design, the command decoder output of the general purpose machine is connected through a matching device to the unit input of the blocking trigger whose zero output is

Card 1/3

connected through a matching device to the cycle pulse gate of the general purpose machine. The command decoder output is connected through a matching device to the first input of a gate whose second input is connected to the zero output of a trigger-distributor. The output of this gate is connected to the first inputs of the beginning address gates of the argument block in the operational memory unit of the general purpose machine, to the first inputs of the beginning address gates of the normal subprogram in the semiconstant memory unit of the small machine, and to the first inputs of the cycle number index gates of the normal subprogram. The second inputs of the index gates are connected through a matching device to the digit outputs of the address portion of the command register of the general purpose machine. The outputs of these gates are connected respectively to the one inputs of the address register triggers of the operational memory unit of the general purpose machine. The outputs of these triggers are connected through a matching device to the address code shaper of the general purpose machine and to the one inputs of the command address register triggers of the small machine. The outputs of these triggers are connected to the address decoder of the semiconstant memory unit of the small machine and to the one inputs of the cycle counter triggers of the normal subprogram. The counter output is connected to the zero inputs of the trigger-distributor and blocking trigger. The outputs of the code shapers of the general purpose machine are connected through a matching device to the first inputs of a group of number admission gates whose second inputs are connected to the

output of the control microprogram device and whose outputs are connected to the inputs of the arithmetic device registers of the small machine. The outputs of the arithmetic device registers are connected to the first inputs of a group of number distribution gates whose second inputs are connected to the output of the control microprogram device and whose outputs are connected through a matching device to the code shaper inputs of the general purpose machine. The output of the cycle generation of the small machine is connected to the first input of a gate whose second input is connected to the one input of a synchronizing trigger and whose output is connected to the first input of a cycle pulse collecting circuit. The output of the cycle generator of the general purpose machine is connected through a matching device to the first input of a gate whose second input is connected to the zero output of the synchronizing trigger and whose output is connected to the second input of the cycle pulse collecting circuit. The inputs of the synchronizing trigger are connected to the outputs of the control microprogram device. The output of the cycle pulse collecting circuit is connected to the input of the microcommand counter of the small machine.

TITLE: Summator for simultaneous addition of several binary terms. Class 42, No. 188151 [announced by Institute of Mathematics, Siberian Division AN SSSR (Institut matematiki Sibirskogo otdeleniya AN SSSR)]

SOURCE: Izobreteniya, promyshlennyye obrastay, tovarnyye znaki, no. 21, 1966, 159

TOPIC TAGS: addor, binary number, coincidence circuit

ABSTRACT: This Author Certificate presents a summator for simultaneous addition of several binary terms with storage of the transfers and accumulation of the results, consisting of single-digit triple-input summators. To increase the response rate, the outputs of the combination circuits of each of the single-type p-digit units of the summator are connected through coincidence circuits digit by digit to the inputs of the intermediate result storage register of the given unit. The outputs of the digit groups of the intermediate result storage register are connected through coincidence circuits and auxiliary storage units digit by digit to the inputs of the corresponding digits of each unit of the summator. The outputs of the new term registers are connected digit by digit to the free inputs of the summator units. To generate the total sum in normal form with minimal additional equipment cost, the

Card 1/2

lowest output channels of the combination circuit of each unit are connected digit by digit through coincidence circuits to the inputs of the intermediate result storage register of the given unit. The following output channels of the combination circuit of each unit are connected digit by digit through coincidence circuits to the inputs of the intermediate result storage register of the given unit and also to the inputs of the first group of coincidence circuits of the highest unit. The outputs of the corresponding digits of the new term registers are connected to the first inputs of the second group of coincidence circuits of each summator unit. The outputs of the first and second groups of coincidence circuits are connected to the inputs of the corresponding accumulation circuits whose outputs are connected to the free inputs of the corresponding digits of the following highest unit. A storing summation signal is fed to the second inputs of the second groups of coincidence circuits of all units. An assimilation signal is fed to the second inputs of the first groups of coincidence circuits of all units. To increase the response rate, the outputs of the combination circuit of each unit are connected through the first group of coincidence circuits to the inputs of the first intermediate result storage register of the given unit and through the second group of coincidence circuits to the inputs of the second intermediate result storage register of the given unit. The outputs of the first register are connected through the third group of coincidence circuits to the first inputs of the accumulation circuits. The outputs of the second register are connected through the fourth group of coincidence circuits to the second inputs of the accumulation circuits. The inputs of the accumulation circuits are connected digit by digit to the corresponding inputs of the given and following summator units.

TITLE: Investigation of One Part of the Four-component System Fe-Cr-Ni-Mn
(Issledovaniye chasty chetvernoy sistemy Fe-Cr-Ni-Mn)

PERIODICAL: Investiya Akademii nauk USSR. Otdeleniye khimicheskikh nauk,
1959, Nr 6, pp 963-970 (USSR)

ABSTRACT: The phase diagram of the four-component system mentioned in the title is investigated in one section (I) (Fig 3) on the line with constant Ni-content of 10 %, parallel to the Fe-Cr part. Alloys were investigated with variable content of Cr in 6 sections and Mn (Cr 10, 20, 30, 50, 60 and 75 %, and a change of the Mn-content at each of these values in the range of from 0-70 %). Armco iron, metallic chromium, and electrolytically produced nickel and manganese were the components of the alloys. The chemical composition of the alloys investigated is given in table 1 (Table 2 contains data on their microstructure). With the alloys the microstructure, the strength, the electric resistance, and with some, also their magnetic properties were investigated. The data obtained by these investigations served for constructing the diagram of the system. In the iron corner of this diagram the boundaries of the phase ranges α , $\alpha + \delta$, δ and δ' , and that of

Card 1/2

Investigation of One Part of the Four-component System SOV/62-59-6-2/36
Fe-Cr-Ni-Mn

a number of interlaying ranges were determined. Furthermore, the dependence of the change in strength and electrical conductivity on the composition and the phase construction was investigated. Alloys with a composition of 49.7 % Mn, 38 % Cr, 5 % Ni, 7.3 % iron exhibited the highest ohmic resistance ($1.31 \Omega/\text{mm}^2$). In the system investigated 15 different phase ranges were determined. The most important share in the phase diagram is held by the solid austenite (γ) solution with manganese. The phase ranges α , γ and σ denote: a solid solution, α -Fe on Fe-basis (ferrite), and α -Cr on Cr-basis, the solid solution γ -Fe (austenite), σ the phase of the compound FeCr, α -Mn the solid solution on α -Mn-basis. There are 12 figures, 3 tables, and 9 references, 6 of which are Soviet.

Method of determination of butoxy groups. S. A. a
Kantorovich and O. N. Alceina. *Byull. Obshch. Khim.*
Lokalizats. Prom. 1953, No. 4, 70-4; *Referat. Zhur.*
Khim. 1953, No. 7122.—Butoxy groups in phenol-formalde-
hyde resin intermediates (monobutoxy, monomethylolphenyl-
olpropane, dibutoxydimethylolphenylolpropane, mono-
tributoxytrimethylolphenylolpropane, monobutoxy-
monomethylolphenylolpropane, monobutoxytetramethylolphenylolpropane) were detd. by a
mikromethod based on the reaction: $ROR' + HI =$
 $R'I + ROH$; $R'I + Br_2 = R'Br + HBr$; $1Br + 2Br_2 +$
 $3H_2O = HIO_3 + 5HBr$; $HIO_3 + 5KI + 5H^+ = 3I_2 +$
 $3H_2O + 5K^+$; $I_2 + 2Na_2S_2O_3 = 2NaI + 2Na_2S_4O_6$. The
results agreed well with those obtained by the macro-
method.

TITLE: Investigation of the process of equilibration in digital automatic AC compensators [This paper was presented at the 6th All-Union Conference on Automatic Control and Methods of Electrical Measurement held at Novosibirsk in Sept., 1964]

SOURCE: Avtometriya, no. 2, 1965, 69-76

TOPIC TAGS: hodograph; digital system

ABSTRACT: The article presents a graphoanalytic method for investigation of the process of equilibration in digital automatic rectangular-coordinate ac compensators which consists of construction of a hodograph of the difference voltage ΔV on the plane of compensating voltages and analysis of the nature of its displacement. A dependence is produced for the allowable degree of interdependence of the equilibration circuits and the compensator parameters. Orig. art. has: 4 figures and 12 formulas. [JPRS]
